Pergola systems – Enabling you
to enjoy the open air ...
with protection when you need it

The Pergola system, developed and patented by s: stebler, has many advantageous features: it makes the apparently impossible possible! You sit in the open air, but as soon as you require cover from the sun or rain... it's available. The cover is versatile in use: it can be fully or partly retracted. The system is multifunctional in the proven s: stebler manner with many options. The quality throughout and longevity are of the same high standard as that of the other s: stebler developments.

Multifunctional and variable. Whether in the open air version, pergola or winter garden – the s:stebler-Pergola system can be installed. The roof size can be freely selected, the simple safety glass is available fully transparent and in many colour shades. In addition, many different curtain systems are available to choose from – shading is also possible by selecting the type of glass (for example with silk screen printing or colour tinting).

Proven and comfortable. The technology of the Pergola system has been tried and tested over many years and has also been subject to continuous development. It can be conveniently operated with an electrical control system – and to suit individual requirements. The first class materials used in construction and thorough processing in manufacture ensure extreme durability.
